ARCHITECTURE DESIGN STAGE ON BUILDING PLANNING

During carrying out professional work at Hadiprana Design Consultant, I worked under the supervision and guidance of the Architecture and Landscape Studio Division. In professional work, I had the opportunity to participate in the implementation of the renovation design process in the 5 Hadiprana Design Consultant projects. The projects consist of the renovation of the Purwokerto GBI, renovation of a residential house on Jl. Galuh Kebayoran Baru, renovation of Exterior Retail Plaza Indonesia, renovation of Villa Mandapa Bali and renovation of residential houses on Jl. Indramayu Menteng. I learned a lot of things during my professional work, starting from knowing how to work on a real projection image, being more knowledgeable about working on parts is very important, knowing how important it is to manage time, knowing that the deadline is very important and knowing how important it is to do assistance and revision. From this, I became aware of the importance of work in team work, the importance of communicating between leaders and their members or between members so there is no miss communication. In addition, Praktikan also knows the stages of building plans at the Hadiprana Design Consultant and from all the projects that I work on, the stages of the start of the work of each project are different. The stages that exist in the Hadiprana Design Consultant are, first, the planning stage and site survey. The next stage is to conduct a briefing with the designer and enter the Pre-Design stage to make several design alternatives. The next stage starts to enter the design detail stage and goes to the final design stage. And the last stage is the implementation phase of projects that are ready to be implemented.

Keywords: planning stages, assistance, image revision, communication
