REUTILIZATION OF DCRAFT INDONESIA WOOD TABLEWARE INTO ECO-FRIENDLY DECORATIVE PRODUCTS

In carrying out professional work activities that lasted for 3 (three) month or 400 hours, practitioners as Design Development realized that wooden tableware products are increasingly popular due to their natural aesthetics, durability, and environmentally friendly nature. In the custom design process, wood is the main choice due to its flexibility to be shaped according to functional and visual needs.

Wooden tableware often uses upcycling techniques, where leftover wood pieces from other industries are reused, creating products with high added value. Each item can be customized based on the shape, size, pattern, and type of wood used, creating a product that is unique and personal to the consumer. The sustainability-focused production process also enhances the appeal of the products, supporting the growing eco-friendly movement among modern consumers.

Keywords: *tableware, wood, upcycling*
