*Bandung Regency is one of the regions in Indonesia that is vulnerable to natural disasters, particularly floods, due to its geographical conditions that contribute to disaster susceptibility. Recurrent disasters can impact an individual's psychological state. Individual disaster resilience is essential for understanding and processing disaster-related information to make appropriate decisions when facing natural disasters. This study aims to examine the resilience of adult individuals in Bandung Regency in responding to flood disasters. Preparedness and resilience are crucial to facing future disasters that may occur unexpectedly. The study involved 360 respondents, with results indicating that the individual disaster resilience of adult individuals in Bandung Regency tends to be high.*
