²⁾ Lecturer of Visual Communication Design, Universitas Pembangunan Jaya

The problem that arises in undeveloped countries is that it is difficult to eliminate crime cases. Lack of education in society and declining economic factors are the forerunners to a crime tragedy. In fact, Indonesia is still ranked 11th as the least safe country in Asia. This data is still not the whole of the core problem due to the large number of cases that have not been recorded in police cases. This is due to a lack of police responsibility, a lack of time to eradicate and investigate cases, a lack of evidence of public assistance, and also the absence of a tool or media that can help in eradicating crime cases that occur in Indonesia. To prepare the written report, the author took a research approach using a qualitative approach. The choice of using a qualitative approach is based on the superiority of the approach in obtaining data. By using a qualitative approach, it allows the author to obtain further explanations and information that are more detailed and factual.

The aim of this research is to analyze problems in society and provide ideas in the form of prevention and mitigation that can be used to solve a problem.

Key words: Crime, Technology, UI\UX, In danger
