Violence against women, particularly sexual harassment, continues to rise in Indonesia, especially in public spaces such as public transportation. Data shows that reporting is low due to social stigma and a lack of trust in handling mechanisms. This study aims to design a UI/UX prototype for a digital protection application for working women aged 25-40. The application is designed with features to ensure safety and comfort, such as a travel companion, SOS button, reporting tools, consultation, community space, and safety guidelines to enhance the sense of security. Using a qualitative research method with a Define and Design (DnD) approach, the study focuses on prevention, protection, recovery, and raising awareness of digital safety. It is expected that this solution will minimize the risk of sexual harassment, encourage reporting, create a safer environment, raise awareness of women's rights, and provide secure access through a digital-based application. This research also contributes theoretically to security-based UI/UX design and offers practical benefits for women, society, and educational institutions.

Key words: *Protection Application, Sexual Harassment, UI/UX Design, Women Workers*
