Self-esteem is referring to a person's or individual's evaluation of the themselves, both positive and negative. In adolescence, individuals begin to know dating, dating is not only has positive impacts but also has negative impacts. One of the negative impacts is the probability the experience dating violence both offline and online. The online dating violence usually known as cyber dating violence and can be nagtive catalyst to individual's self-esteem. Advances in technology affecting the intensity of adolescents using technology, it can increase the probability youths have the opportunity to experience violence indirectly or it can be called cyber dating violence. Cyber dating violence can be defined as controlling, harassing, stalking, and abusing a partner through technology and social media. The factors that influence cyber dating violence are aggression and romantic jealousy. Someone who experiences cyber dating violence will have an impact on self-esteem. Previous research has shown that cyber dating violence can affect self esteem. Therefore, with different respndents, this study aims to determine the effect of cyber dating violence on young women. The research method used is quantitative, data is collected through a questionnaire on google form. The results of this study indicate that the dimensions of psychological aggression and sexual aggression have a positive effect on the self-esteem of adolescent victims of CDV.
