The impact of information technology on various sectors including the social sector has had a positive impact on the El-Roi Sawangan church, namely information technology helps church administrators in managing data and disseminating information. El-Roi Sawangan Church is a church that has long been established, and has grown into a church that has many congregations and various communities in it. However, over time, the process of managing congregation data was difficult, because church administrators were required to hold meetings with prospective congregations in the church. While currently in the Covid-19 pandemic. The absence of a backup file or backup makes the data of the El-Roi church congregation vulnerable to loss or damage. In the dissemination of information, church administrators do not take full advantage of information technology, so that information is not spread properly and congregants find it difficult to know church information. Therefore, now the El-Roi church wants to solve this problem by creating a website-based church management application. This application aims as a media for managing congregation data and church information. With this website-based church management application, it is hoped that church data management and delivery of church information can run quickly and easily. Currently the application has reached the testing phase with church administrators and congregations.
