IMPLEMENTATION OF USER-RESPONSIVE ARCHITECTURAL DESIGN AND ENVIRONMENT ON DESAINBANGUNAN.ID PROJECT

Architecture has two different elements, namely episteme which means knowledge and technology which means craft, these two sides are united by the architect through the design process. In developing designs, architects must combine their knowledge of technical matters with creativity in art, these two things can be developed through learning and practice during lectures in university, as for other ways to develop an architect's knowledge, one of them is intrenship program, in addition to knowledge that affects design, users and site conditions can also affect the design so one needs to have a need for user and site issues.
