Food Station Tjipinang Jaya is a Regional Owned Enterprise (BUMD) that focuses on regulating food ingredients in Indonesia. The company that works together with the Cipinang Rice Main Market has a company record containing the finances issued by the company, or a record of company needs required by one of the divisions for the benefit of the company, and others. These company records are called archives. The archive is needed by the company in making decisions in meetings or seeing the state of the company. Because of the importance of the archive, the researcher created an application that functions as an archive storage. In addition to making archive storage safer, this application can simplify and speed up all activities at the Food Station company. With applications made with Hypertext Preprocessor (PHP), and MySQL as a repository for these archives, making this archive storage application more secure.

Keywords: E-Office, Ease, Security, Archives, Company.
