Today's technology has a big impact in all aspects of any life, even in religious organizations such as the Church is also one of the impacts that affect today's technology. The Western Indonesian Church (GPIB) Filadelfia has a special service for grief, namely the Yusuf Arimatea Grief Service (PKYA). Currently PKYA prepares mourning services by preparing monthly dues payments, with monthly dues payments, PKYA Parties will prepare from administration to worship for bereaved families or PKYA members. The purpose of this research is to be a solution to solve PKYA problems for data collection of registered congregations and collection of contributions, because PKYA still uses web messengers and intermediary applications to carry out registration and payment transactions so that it can trigger data misplacement. The purpose of this research is to create a website that will be used by PKYA, with this website it can improve the process of collecting member data and fees currently being run by PKYA so that it is easier and faster for administrators and members to register and pay.
