### **SUPPORTING ELEMENTS IN THE APPLICATION OF THE DESIGN PROCESS**

*Internship can provide experience for students who carry it out, this activity provides a lot of new knowledge that previously had not been obtained by other practitioners or students. While carrying out internship at Bagas and Associates, the practitioner works under the supervision and guidance of the Design division. In Internship, the practitioner has the opportunity to participate and be directly involved in several projects being carried out by Bagas and Associates such as the Rejuvenation of the Pertamina Balongan Administration Office, the Griya Asri Cimekar Housing, and the Renovation of the Mandiri S. Parman Office House. In the Balongan and Cimekar projects, the concept of the building elevates the local social culture so that the building has a more regional identity. During the practitioner's internship, the practitioner is asked to assist in redrawing the existing floor plan, collecting and analyzing site data and finding reference images or shapes of a building or room. Some of the things that are done by the practitioner can be called the search for supporting elements in a design process, for this reason this is the focus of the discussion of the practitioner in this report.*

**Keywords:** *Supporting elements, design process, site analysis*
