This study aims to know the correlation between self-esteem and time attitude on college students in Indonesia. This study use quantitative approach with correlational analysis. The respondents in this study were 353 college students aged 18-25 years. The result of this study show that there is a significant correlation between self-esteem and time attitude's subscale (past positive: $r=0,28$; $p<0,001$ / past negative: $r=-0,35$; $p<0,001$ / present positive: $r=0,50$; $p<0,001$ / present negative: $r=-0,51$; $p<0,001$ / future positive: $r=0,44$; $p<0,001$ / future negative: $r=-0,45$; $p<0,001$). This shows that the higher the subject's perception about the positive dimension of time attitude, the higher the subject's self-esteem. Conversely, the lower the subject's perception about the positive dimension of time attitude, the lower the subject's self-esteem. However, the higher the subject's perception about the negative dimension of time attitude, the lower the subject's self-esteem. Conversely, the lower the subject's perception about the negative dimensions of time attitude, the higher the subject's self-esteem. Other result found that 7% of past positive, 12% of past negative, 25% of present positive, 26% of present negative, 19% of future positive, 20% of future negative can be explained by self-esteem.
