The Sarinah Building is a high-rise building with the first commercial function in Indonesia and has been through some changes three times in 1984, 2000, and 2020. The Jakarta City Government has revitalized it to preserve historic buildings and improve the regional economy. Revitalization in 2020 includes changes to the design of the outside part of the building, exterior, some functions of the interior, and also the interior itself. This revitalization, especially the design of the outdoor has a positive impact on the Thamrin Area in the formation of a livable city. The new design for the outdoor area has succeeded in becoming a public space that encourages people to socialize and interact. This is one of the principles of a livable city. A livable city supports increasing the comfort and safety of residents living in the city/region. This study aims to examine the revitalization of the Sarinah Building and its impact on the formation of a livable city in the Thamrin area of Jakarta. This study uses a comparative descriptive method by examining the revitalization of the Sarinah Building against the livable city criteria.
