### **INFORMATION SYSTEM DESIGN WITH AGILE MODEL APPROACH**

In this era of development, technology is one of the needs of society. One of the things that is very important, especially in the midst of the conditions or era of the COVID-19 pandemic. Many technologies are increasingly experiencing rapid development. As time goes by, technology now accompanies every line of people's lives.

Until now, many companies are using or utilizing technology as a means of their business, of course, in order to reach more users from various regions. Because technology actually makes it easier to reach and facilitate various processes that exist in everyday life.

To support and maximize the technology used in a company, it is also necessary to design a system that can support the company's role, especially in the recapitulation of attendance in a company. As we know in the current era of working from anywhere, technology is needed that can optimize and recapitulate employee attendance from anywhere without having to come to the office, in order to facilitate business processes.

By optimizing the online presence process, it is hoped that business needs that are closely related to this technology can run smoothly without a hitch and can be resolved immediately if they experience some technical problems that require immediate repair.
