Ordering refilled gallon drinking water is currently quite in demand, but there are still several factors that affect the ineffectiveness of the transaction process. These issues should be overcome if a dedicated ordering information system is used to provide better service and achieve business goals. Every transaction process that occurs in this business can be done on the application, from ordering to payment confirmation. This information system includes two sides, namely the customer side and the merchant side which are integrated with each other. And of course it will make it easier for users but besides that it can also facilitate transactions so that they can be carried out more effectively and efficiently.
