The need for precise and accurate information is urgently needed at this time because of the increasingly rapid world development. This development itself is needed in almost all activities carried out by humans today, including business. Likewise in the field of trading gallons / LPG, some people think this is a tiring effort and the profits are not worth it, it is a wrong assumption. This line of business is a very promising field where the goods sold are basic necessities used by almost all people, from street food vendors to large restaurants need this. In focusing the existing problems and so as not to deviate from the actual subject matter regarding the Transaction and Bookkeeping Information System on the sale of mineral water and LPG gas at Fauzan's shop with an Object Oriented Methodology. To design a transaction application, it is necessary to search for information on user needs, this can be done by conducting direct interviews with prospective users, viewing data that has been created by users, conducting library studies. Next, the design for the transaction application at the Fauzan store was carried out. After the design is in accordance with the needs, the next step is to test the design that has been made whether it is in accordance with what is needed and check the readiness of the application..
