### **STUDY OF SPECIFICATIONS FOR THE USE OF MATERIALS IN RESIDENTIAL HOUSE BUILDING**

*While carrying out professional work within a period of three months at PT. HydeLiving, the practitioner works under the principal as an intern. In this professional work report, the practitioner works on several projects, which require the practitioner to describe some of the materials used in installing cabinets in the interior. In carrying out this professional work, the practitioner performs many assignments from the beginning of the planning to the final visualization. In this plan, the practitioner is more dominant in recaping the standardized deck material used by PT. HydeLiving The end result of the learning during the Professional Work that the practitioner gets is to be able to understand how the classification of materials greatly influences the determination of the design and design of the building. Because a room cannot be separated from the need for aesthetic functions, of course this becomes the main focus for the practitioner to be able to determine more deeply to be developed again by other writers.*
