PT. Bintang Anugerah Sukses is a company engaged in retailing smartphones and is one of the authorized distributors of Samsung smartphones. Currently, the business process documentation is done manually using bookkeeping methods. However, the manual bookkeeping method is facing challenges as the number of orders continues to increase, making it ineffective and unable to keep up with the demand from consumers. Due to the manual recording process, details of customer data and product information are often not accurately recorded, resulting in financial losses for the company. This research aims to analyze and design a web-based sales information system for PT. Bintang Anugerah Sukses. The research is conducted using a qualitative method with a case study approach, where data collection is done through observation, literature review, and interviews. The system development method used is the waterfall method with system modeling using Unified Modeling Language (UML). The final result of this web-based sales information system includes digital document archiving and a feature for printing receipts to expedite the sales process and avoid losses.
