Based on a 2019 UNESCO survey, Indonesia is among the countries with the lowest literacy rates. To address this issue, efforts to improve literacy are necessary as it has become a concerning matter and an irony amidst the rapid development of information technology. One approach worth trying is to build an information system or application that can enhance literacy by providing easy access for students, who are the future generation, to obtain information about quality readings and also to serve as a discussion platform. The step of "designing and developing a web-based book review and discussion application using the RAD method" is expected to improve literacy levels, starting from the school environment.
