"Despite the construction of land for specific purposes, it is often diverted for different functions. This becomes a specific focus in architecture for analyzing efficient use. A combined agricultural environment in Tangerang Selatan served as a center for managing and educating agricultural activities in open land. However, it has experienced a shift in function as a Covid-19 isolation site. To revive its original activities, there is a need for development that can answer the reasons for the shift in function and create an agro-edutourism facility that promotes biophilic design to bring nature closer to human environments and make humans aware of the importance of nature for life."

Keywords: Verticulture Agriculture, Agro-Edutourism, Biophilic
